

Field editing

Adjusting the field shape is very easy and quick to accomplish. This can be done while adding fields or later by using the **Edit shape** function in the **Status** menu.

- Go to the **Status** menu and click **Edit shape**.

- In the new window, the field will be highlighted and tools for adjusting the shape will be visible.
 - To **move a point**, drag and drop it.
 - Click on the boundary and slightly drag it to **add a point**.
 - To **delete a point**, move mouse over the point, wait till it becomes red and click on it.

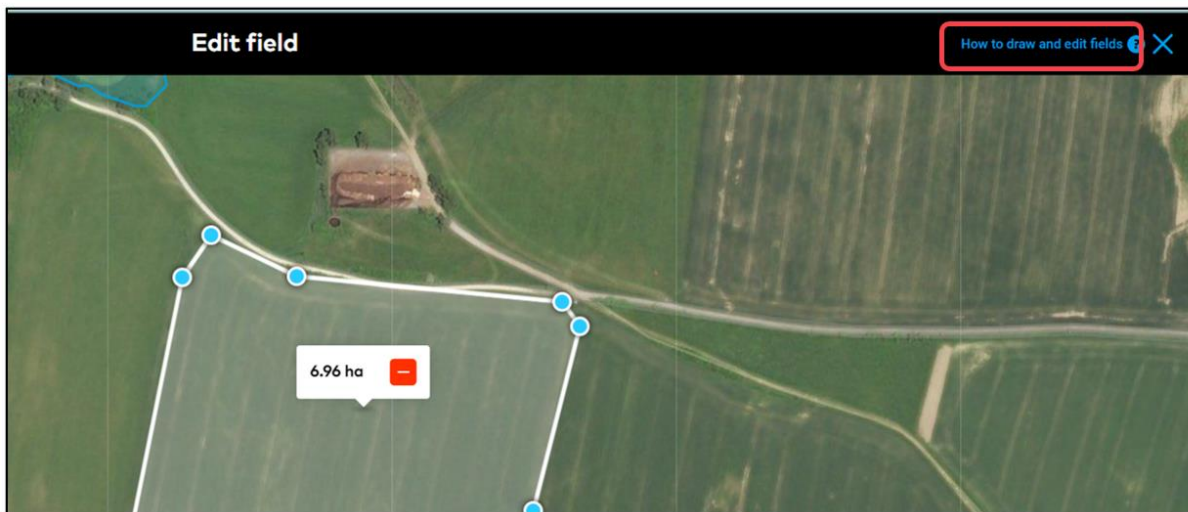

1. **Field simplification** – Move the slider to reduce the number of points, then move, add or delete any of them.
2. **Cut out** – It is important to remove parts of the field which are not in use. A tree or a windmill can cause problems when generating application maps.
3. **Draw** – Draw a new shape that is treated as part of the field. This new shape can also be disconnected from the original shape.
4. Click **Done** to save the changes made or **Discard** to cancel all the changes.
5. Use the button to **delete** field.

Note: Only one field can be edited at a time and if more than one shape is drawn, they will be counted as one field.

- Click on **How to draw and edit fields** anytime for detailed instructions.
